

DEATHS

Statistical Overview

There were 74,800 deaths of New Jersey residents in 2000 (Table M3). This represents a 1.1 percent increase over 1999. The crude death rate was 889.0 per 100,000 population and the age-adjusted rate was 852.4 (Table M1 and Figure M1). Although the age-adjusted mortality rate remained nearly constant from 1999 to 2000, it had decreased 9.4 percent from the rate in 1990 (Table M1). The age-adjusted death rate for males was 45.8 percent higher than the rate for females and the age-adjusted death rate for blacks was 33.2 percent higher than the rate for whites in 2000 (Table M2 and Figure M2). Both figures represent a slight widening of the gaps that existed in 1999 (Baron Duffy, 2002). For persons born in New Jersey in 2000, average life expectancy was 77.6 years. For females, it was 80.1 years and for males it was 74.8 years. Life expectancy for whites was 78.2 years and 71.8 years for blacks (Table M10 and Figure M4).

Causes of Death

The ten leading causes of death remained unchanged from 1998 and 1999: heart disease, cancer, stroke, chronic respiratory disease (CLRD), diabetes, unintentional injuries, influenza and pneumonia, septicemia, kidney disease, and Alzheimer's disease (Table M11). These ten causes of death accounted for 80.8 percent of deaths in 2000 (Table M12). The three leading causes of death among both sexes and all races (heart disease, cancer, and stroke) accounted for 61.6 percent of all deaths. Chronic respiratory disease (CLRD) was the fourth leading cause of death for females and fifth for males. Unintentional injury was the fourth leading cause of death among males, while it was ninth among females (Table M19). HIV disease was the fourth leading cause of death among blacks and the nineteenth among whites (Table M20). Unintentional injuries replaced cancer as the leading cause of death among residents 25-44 years old (Tables M12).

There were 555,692 years of potential life lost (YPLL) before age 75 among New Jerseyans in 2000 (Table M21). YPLL is the sum of all the years of life not lived by persons dying before reaching age 75 and is used as a measure of premature death. For males, females, whites, and blacks, cancer was the leading cause of YPLL, followed by heart disease (Tables M21-M23 and Figures M8-M10). Unintentional injury was the third leading cause of YPLL among all groups except blacks for whom HIV disease was ranked third (Tables M21-M23 and Figures M8-M10).

The age-adjusted death rate due to cancer was 8.8 percent lower in 2000 than it was in 1994. Age-adjusted deaths rates for most cancer sites decreased over the time period (Table M24). In 2000, trachea, lung, and bronchus remained the most common cancer mortality site, followed by cancer of the colon, rectum, and anus and cancer of the breast (Table M24). Over 58 percent of cancer deaths occurred among those aged 65-84 (Table M25). In 2000, the male age-adjusted death rate for cancer of the trachea, lung, and bronchus was 70.9 percent higher than the rate for females (Tables M26-M27).

Firearms caused 341 deaths in 2000. Of those, 172 were homicides, 154 were suicides, 12 were accidental, and 3 were of undetermined intent (Tables M30). The age-adjusted firearm death rate among males was 11 times the rate among females and the rate among blacks was 3.5 times the white rate (Table M30A). Drug-related causes such as mental and behavioral disorders due to psychoactive substance use, accidental overdoses, and intentional poisonings resulted in 794 deaths, a 4.9 percent increase over the number in 1999 (Table M31). Alcohol-related causes increased 9.6 percent since 1999 and 21.7 percent since 1998 to 500 deaths in 2000 (Table M32). In 2000, the age-adjusted drug-related death rate among males was 2.9 times that of females and the age-adjusted alcohol-related death rate among males was 3.1 times the rate among females (Tables M31-M32).

Infant, Fetal, and Maternal Mortality

The number and rate of infant deaths decreased from 1999 (Table M40). The infant mortality rate among black non-Hispanics remained more than three times as high as the rate among white

non-Hispanics (Table M41). Nearly seventy percent of infant deaths occurred in the neonatal period (within the first 27 days of life). Infants who were part of a multiple birth were four times as likely to die within the first year of life as singletons. Mortality was negatively related to birth weight and gestational age. Infants whose mothers received no prenatal care were more than eight times as likely to die within the first year of life as those whose mothers received early prenatal care. Infant mortality rates decreased with increasing maternal age until the 40-44 age group where rates rose again. Infant mortality rates were about twice as high for infants of unmarried mothers versus married mothers and for mothers who smoked during pregnancy versus mothers who did not smoke during pregnancy (Table M44). More than half of infant deaths had a medical risk factor reported on their birth certificate. Previous preterm or small-for-gestational-age infant, incompetent cervix, and hydramnios/oligodramnios were the most commonly reported medical risk factors among infant death records. Of newborns whose mothers had an incompetent cervix, 5.7 percent died within the first year of life (Table M45). Congenital malformations, disorders related to short gestation and low birth weight, and sudden infant death syndrome (SIDS) were the three leading causes of infant deaths in 2000 (Table M46).

The fetal mortality rate and the number of fetal deaths decreased from 1999 (Table M40). As with infant deaths, plurality, low birth weight, short gestation, lack of prenatal care, unmarried mothers, and maternal smoking are each correlated with higher rates of fetal mortality (Table M47). Fetal deaths are more prevalent than infant deaths among older mothers and the negative correlation between mortality rates and maternal age reverses earlier - at the 35-39 year age group – than it does for infant mortality rates (Tables M44 and M47). The fetal death rate among black non-Hispanics was three times the rate for white non-Hispanics and Hispanics (Table M48). Cord and placenta complications remained the leading cause of fetal deaths in 2000 (Table M49).

Technical Changes

The data in this report may differ from comparable data presented in previous reports in this series because of six major changes in the reporting and analysis of mortality data. Nationwide, the classification of causes of death (ICD) changed in 1999 and a policy that the standard population used for age-adjustment be changed from the US 1940 population to the US 2000 projected population was also adopted in 1999. In New Jersey, the underlying cause of death from the multiple cause of death (MCD) file compiled by the National Center for Health Statistics (NCHS) was used to produce the tables in this report and the 1999 report. In prior reports, the underlying cause from the single cause of death (SCD) file compiled internally was used. Since the average life expectancy in New Jersey is over 75 years and to be comparable with federal reports, starting with this report, years of potential life lost (YPLL) are presented for persons under age 75 years of age. Previous reports in this series presented YPLL before age 65. Population figures used as denominators in the calculation of 2000 mortality rates are based on the 2000 Census. 1990-1999 mortality rates used population estimates based on the 1990 Census as denominators. Consequently, there may be some breaks in mortality rate trends. Because of these five changes, assessment of trends in death data should be undertaken with caution. Also, since Asian and Pacific Islander and Hispanic ethnicity reporting on death certificates in New Jersey and the rest of the country is known to be undermeasured, mortality data are presented separately for Asians and Pacific Islanders (Tables MA1-MA9) and for Hispanics (Tables MH1-MH9) in a supplemental section near the end of this chapter. In Tables M1-M39, Asians and Pacific Islanders are included in the Other race group. Since Hispanics can be of any race, Hispanic decedents are included in the race group indicated on their death certificates in Tables M1-M39. For more detailed information on these changes, see *New Jersey Health Statistics, 1999*.

The Technical Notes section contains information on sources of data, allocation of data by residence or occurrence, quality of data, racial and ethnic classification, definitions, rates and ratios, and cause of death rankings.

1990-1998 data are from the NJ single cause of death file. 1999-2000 data are from the NCHS multiple cause of death file.

Age-adjusted rates are computed per 100,000 based on the 2000 U.S. standard population.

Crude rates are computed per 100,000 race-, sex-, or age-specific population.

**TABLE M2. AGE-ADJUSTED DEATH RATES BY RACE AND SEX
NEW JERSEY, 2000**

RACE	SEX		
	MALE	FEMALE	TOTAL
WHITE	1,014.9	701.6	831.6
BLACK	1,385.7	918.3	1,107.7
TOTAL	1,039.7	719.6	852.4

Age-adjusted rates are computed per 100,000 based on the 2000 U.S. standard population.

Total race row includes races other than white and black.

**FIGURE M2. AGE-ADJUSTED DEATH RATES BY RACE AND SEX

VINELAND	634	1,126.7	1,000.7
WAYNE	555	1,026.5	797.8
WEST NEW YORK	269	587.7	621.5
WOODBRIIDGE	800	823.0	839.0

Municipalities were chosen based on population size (>40,000), accuracy of reporting of residence on certificates, and availability on the multiple cause of death file.

Crude rates are computed per 100,000 estimated municipality population.

Age-adjusted rates are computed per 100,000 based on the 2000 standard population.

TABLE M6. MORTALITY BY MONTH AND DAY OF WEEK
NEW JERSEY, 2000

MONTH	NUMBER OF DEATHS	PERCENTAGE	AVERAGE PER DAY
JANUARY	7,869	10.5	254

1995 and 2000 data are from the NCHS multiple cause of death file.

1995 deaths were classified by ICD-9 and have been comparability-modified. See Table A for preliminary comparability ratios.

Age-adjusted rates are computed based on the total population and the 2000 standard, except for cancer of the prostate for which the rate is based on the male population and cancers of the uteri and ovary for which the rate is based on the female population.

** The number of deaths is too small to calculate a reliable rate. -- No comparable category in ICD-9.

TOTAL	766	6.6

Rates are computed per 1,000 age-specific or race/ethnicity-specific live births plus fetal deaths.
** The number of deaths is too small to calculate a reliable rate.

**TABLE M49. LEADING CAUSES OF FETAL MORTALITY
NEW JERSEY, 2000**

CAUSE OF DEATH (ICD-10 CODES)	TOTAL		WHITE NON-HISPANIC		BLACK NON-HISPANIC		HISPANIC	
	RANK	NUMBER	RANK	NUMBER	RANK	NUMBER	RANK	NUMBER
Fetus affected by complications of placenta, cord, and membranes (P02)	1	204	1	79	3	61	1	42
Fetal death of unspecified cause (P95)	2	178	2	61	1	68	2	34
Fetus affected by maternal complications of pregnancy (P01)	3	143	3	53	2	62	3	20
Congenital malformations, deformations, and chromosomal abnormalities (Q00-Q99)	4	69	4	42			10	13
Disorders related to short gestation and low birth weight (P07)	5	46		8	4	29		9
Fetus affected by maternal conditions that may be unrelated to present pregnancy (P00)		35	5	12	5	12	5	11

TABLE A. ICD codes and preliminary comparability ratios for major cause of death groups used in *New Jersey Health Statistics, 2000*

Cause of death	ICD-10 codes	ICD-9 Codes	Comparability Ratio	Standard Error
Tuberculosis	A16-A19	010-018	0.8547	0.0172
Septicemia	A40-A41	038	1.1949	0.0042
Viral hepatitis	B15-B19	070	0.8343	0.0120
Human immunodeficiency virus (HIV) disease	B20-B24	042-044	1.1448	0.0045
Other and unspecified infectious and parasitic diseases	A00-A09,A20-A39,A42-A44,A46,A48-B09,B25-B99	---	*	*
Malignant neoplasms	C00-C97	140-208	1.0068	0.0002
In situ neoplasms, benign neoplasms and neoplasms of uncertain or unknown behavior	D00-D48	210-239	1.6744	0.0164
Anemias	D50-D64	280-285	0.9559	0.0077
Diabetes mellitus	E10-E14	250	1.0082	0.0011
Nutritional deficiencies	E40-E64	260-269	1.1636	0.0165
Parkinson's disease	G20-G21	332	1.0012	0.0028
Alzheimer's disease	G30	331.0	1.5536	0.0071
Diseases of heart	I00-I09,I11,I13,I20-I51	390-398,402,404,410-429	0.9858	0.0002
Essential (primary) hypertension and hypertensive renal disease	I10,I12	401,403	1.1192	0.0050
Cerebrovascular diseases	I60-I69	430-434,436-438	1.0588	0.0008
Atherosclerosis	I70	440	0.9637	0.0025
Aortic aneurysm and dissection	I71	441	1.0012	0.0010
Influenza and pneumonia	J10-J18	480-487	0.6982	0.0018
Chronic lower respiratory diseases	J40-J47	490-494,496	1.0478	0.0009
Pneumonitis due to solids and liquids	J69	507	1.1185	0.0048
Peptic ulcer	K25-K28	531-534	0.9696	0.0045
Chronic liver disease and cirrhosis	K70,K73-K74	571	1.0367	0.0027
Cholelithiasis and other disorders of gallbladder	K80-K82	574-575	0.9567	0.0060
Nephritis, nephrotic syndrome and nephrosis	N00-N07,N17-N19,N25-N27	580-589	1.2320	0.0044
Pregnancy, childbirth and the puerperium	O00-O99	630-676	*	*
Certain conditions originating in the perinatal period	P00-P96	760-771.2,771.4-779	1.0658	0.0033
Congenital malformations, deformations and chromosomal abnormalities	Q00-Q99	740-759	0.8470	0.0055
Symptoms, signs and abnormal clinical and laboratory findings, not elsewhere classified	R00-R99	780-799	0.9553	0.0034
All other diseases (Residual)	Residual	Residual	*	*

--- No comparable category used under ICD-9.

* Figure does not meet standards of reliability or precision

NCHS does not recommend using these ratios with data prior to 1994.

Caution should be taken when applying the comparability ratios to age-, race-, or sex-specific or age-adjusted mortality data.

* Figure does not meet standards of reliability or precision

NCHS does not recommend using these ratios with data prior to 1994.

Caution should be taken when applying the comparability ratios to race- or sex-specific infant and fetal mortality data.
